Data & Information Management (UPE)

Production Engineering & Geospatial Data - Initiatives - Owned by: GBAs, Contributors, Tiia, Andrei, Olivier, Daniel..

Overview of data types - not sure of value of this all data should be harmonized and stored in a consistent way.

Unified Data foundation - *Move from files to information data backbone dev project?*

Data Harmonization

Enable Engineering Data for AI

Data Governance exploration

Data Handover templates

Standardization: for geospatial we need to make sure our metadata best practices are being used

From AI whisperer chat

Where Ramboll Tech can help is in establishing logical and physical architectures that facilitate interrogation by AI models. The challenge I see with data structures is that it is a matter of organization more than technology.

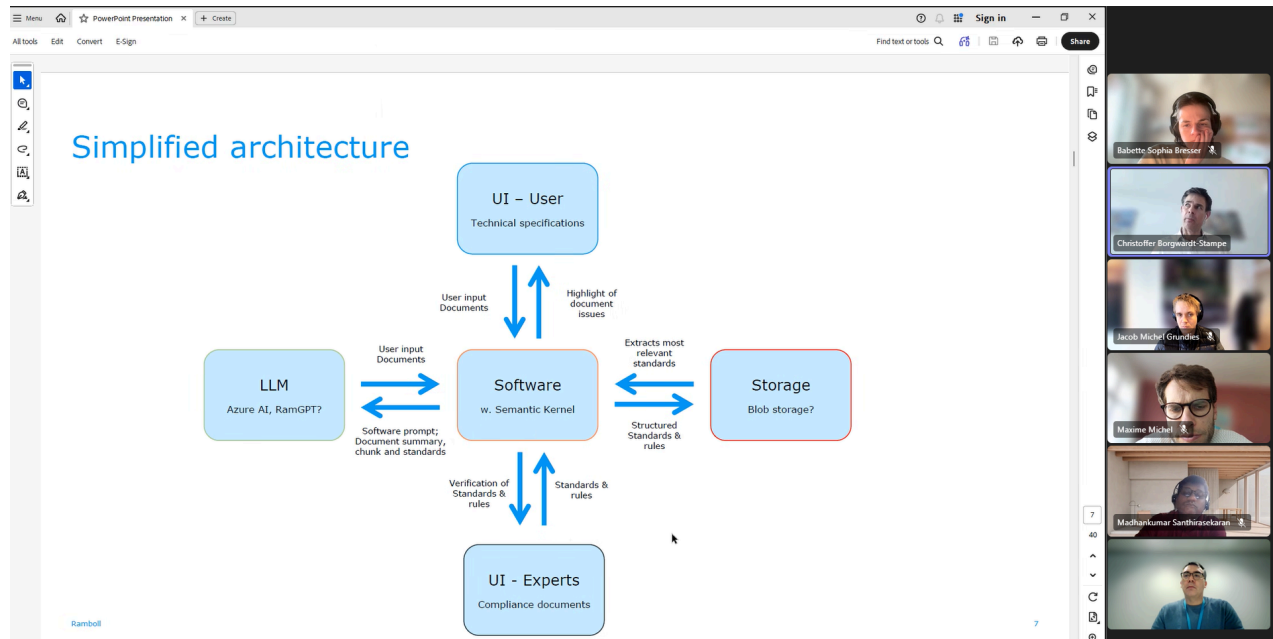

To understand how chemical hazard documents, architectural codes and design best practices must be organized to facilitate AI-assistance in determining design requirements for a specific factory, one must understand the analytical, creative, risk and decision making processes inherent in performing that workflow. Same could be said for the analysis performed by an environmental engineer to identify potentially responsible parties (PRPs) for a polluted watershed. The combination of public records, internal reports, GIS data, corporate history and lab test results (among others) poses a challenge for AI information gathering and synthesis particularly as it relates to the steps required to perform that task.

For Ramboll Tech to develop a centralized strategy for organizing data/information would require omniscient understanding of the work we do across Ramboll's GBAs. It would be a heavy lift even for our small IDT organizations bound to the GBAs. This is why I believe our focus must be on pushing GBA leaders to take ownership for this (information organization/structuring) task. The long term performance dividend AI is going to afford our P&Ls will justify the near term effort.

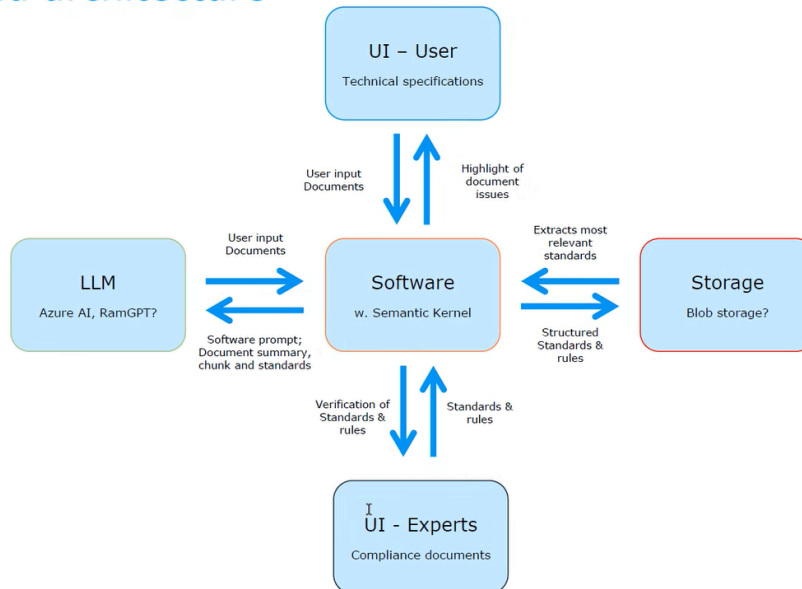

Ramboll Tech will be a critical expert resource to these domain experts in determining what cloud structures are most efficient, how information can be encoded for easier AI model access and how to normalize information to avoid an explosion of duplicative entries as each domain seeks to develop their own approach.

That's how I've been thinking about this information structuring challenge. How does this align with your view?

AI Rule checker From Christoff and Jacob

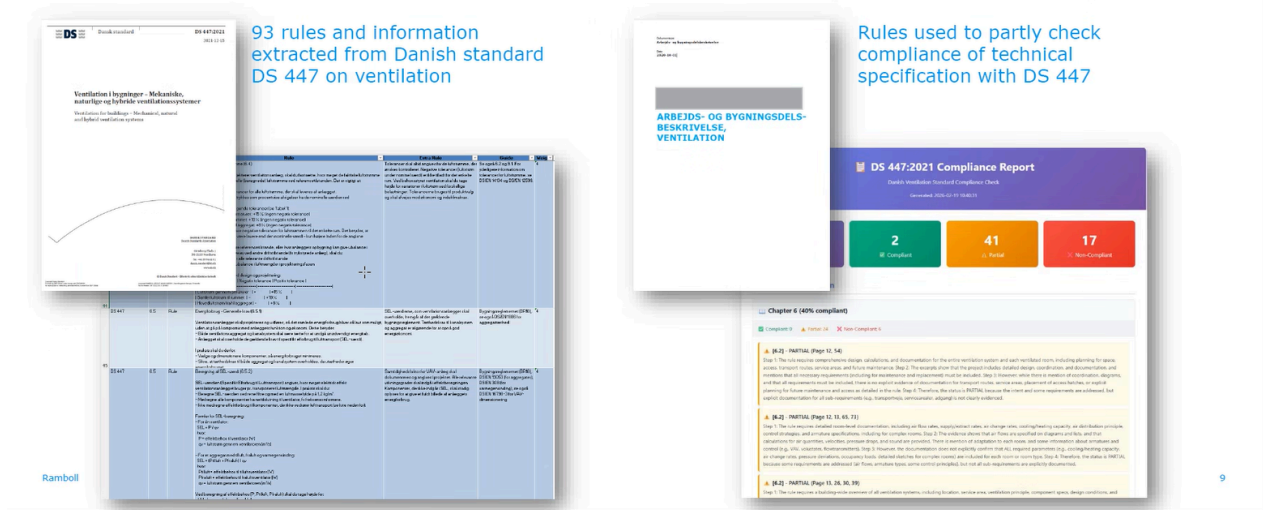

Simplified architecture

Decomposition of documents in to DMS

PoC: AI Rule checker

Demonstrated potential of systematically extracting numerous rules and using these to check specifications

Concept
