Layers (Created with Autodesk)

Technology Value Stream 1 – Building the unified digital backbone

What is the Big Idea?

The Technology Value Stream establishes a single, governed, and scalable digital foundation for Ramboll by building and continuously evolving the Unified Production Environment (UPE) and its core capabilities, potentially including Datum, and connected production platforms.

It transforms technology from isolated tools and platforms into a coherent production system that enables predictable delivery today and AI-enabled engineering tomorrow.

How does it work?

- Removes fragmentation across tools, data and processes
- Ensures engineering data is structured, connected and asset-linked
- Makes automation, analytics and AI deployable at scale
- Standardized how projects start, run and deliver globally

How does it create value?

The Technology Value Stream:

- Empowers our people with intuitive tools, automation and data-driven workflows
- Improves quality and speed through governed data, templates and continuous integration
- Sharpens our portfolio by turning reusable solutions into standardized building blocks

Outcome for Ramboll

A unified, AI-ready production environment where:

- Data has context and ownership
- Platforms work as one system
- Digital delivery is operationally reliable at scale

Ramboll

Technology scope in focus

- Unified Production Environment (UPE)
- Autodesk Construction Cloud (ACC)
- Autodesk Datum & Engineering Data Warehouse
- Integration platform & automation services
- Microsoft Fabric / BI ecosystem

Operational priorities

- Standardized project setup and mobilization
- Asset-linked, governed engineering data
- Automation of validation, handover and reporting
- Interoperability across Autodesk, Bentley, AVEVA, Trimble, Esri, etc.
- AI-ready data foundations

Business impact

- Faster project onboarding
- Higher data quality and compliance
- Lower rework and coordination effort
- Scalable digital delivery
- Foundation for AI-enabled services

This is what I found in some DPE documentation.

Topic 5: Production Environment Layers

North Star

A Unified Production Environment for Digital Design and Service Delivery that connects our products, platforms, and processes — enabling consistent, collaborative, efficient, and AI-driven digital delivery across all GBAs. This will be powered by productising our services, leveraging strategic partnerships and driving global harmonisation.

Unified production environment

-  Build a Unified Production Environment of products, platforms, and processes.
-  Ensure excellence and efficiency through standardised processes and seamless connectivity.
-  Drive innovation and growth via productising our services and leveraging strong partnerships.
-  Deliver greater client impact with faster, higher-quality, tech-enabled projects.
-  Empower our workforce to adopt new products and ways of working, ensuring the full value of the production environment is realised.

Ramboll

Production Environment for Digital Design & Service Delivery
