1. What is UPE?

The **Unified Production Environment (UPE)** is Ramboll's global digital backbone. It is designed to create a seamless, unified digital workspace for engineers and a professional interface for client interaction.

The core philosophy is the "**Parameterized Constructor**" (similar to a modern automotive platform):

- **The Core:** A stable, standardized set of central components and data structures (the "chassis").
- **The Variation:** A library of modular, typical solutions that can be combined and adapted to create thousands of unique, high-quality design projects.
- **The Output:** An intelligent 3D model linked to a structured database and automated documentation.

The **Unified Production Environment (UPE)** is not just a software application; it is a **flexible, API-first framework** designed to integrate Ramboll's engineering DNA into every project. It serves as a "Digital Asset Hub" that captures knowledge from fragmented sources—CAD models, documents, and databases—and transforms them into reusable, standardized assets.

The "Car Platform" Analogy: UPE provides the "Chassis" (the core API, security, and data standards). On top of this, engineers assemble "Modular Blocks" (standardized engineering solutions) to build a "Unique Vehicle" (the specific design project) that is high-quality, parametric, and data-driven.

2. Target Users

- **Design Engineers:** The primary users who utilize the "constructor" to assemble projects using standardized blocks and AI assistance.
- **Project Managers (PMs):** Users focused on project observability, tracking progress, costs, and managing work packages.
- **Global Business Areas (GBAs):** As the "Business Owners," they define the best practices and standards that the UPE must automate and scale.
- **Clients:** Benefit from unified data delivery, clearer project status, and high-quality, standardized outputs.
