UPE Initial Solution Architects Brainstorming

David Thomson

Feel free to reorganize the content, I am just copying from our past sessions. 😊

The 'What'

Capabilities (Simplified)

Properties

- Project-scoped
- User friendly (Most ppl in Ramboll work on several projects at the same time)

The 'How'

Considerations

- scalability
- interoperability
- security
- build vs. buy
- cost of operation/maintenance

Architecture

UPE can be seen as a collection of modules, where each module addresses a particular set of needs, identified as common across Ramboll's project portfolio. From the user's point of view, a module constitutes a logical grouping of features. From the implementor's point of view, a module is made of artifacts, such as:

- templates / configuration files
- approval workflows

- dashboards
- backend automation scripts
- databases
- web applications

Suggested Tech Stack

- Microsoft Teams/SharePoint
- Microsoft Power BI
- Microsoft Power Automate Flows
- Microsoft Planner (offers consolidated views of tasks across all projects)
- Microsoft Azure

We believe in utilizing the existing technology available to us through our Microsoft Office E5 license and leverage the many available extension points and robust APIs to build the UPE in terms of integration on top of robust and secure components, without reinventing the wheel.

Integrations

- CRM
- Maconomy
- Common data environments
- Design tools (templates/scripts/addons)
- BIM/GIS/Visualization tools
